

QUALITY EQUIPMENT DESERVES A QUALITY INSTALLATION

Your company has just made a significant investment in new DC power equipment. Protect that investment by selecting DC specialists to install it. In the planning phase, our design team will work you to ensure all aspects of the project are considered, including site assessment, sizing, equipment integration, testing, and turn-up. At the end of these discussions, we will provide a detailed Method of Procedure.

In order to assure project deadlines are met, BPS provides optional staging and delivery services. Coordination of all equipment and materials occur at our facility, where they are thoroughly inspected, inventoried, and tested. This assures you that any difficulties such as freight damage, part shortages or product defects are resolved **before** our installation team arrives on site.

Once at your location, our experienced service personnel will install your equipment in accordance with all applicable codes. BPS is trained in all major manufacturers' requirements and preferred handling of their equipment; in fact we are "factory certified" to perform installations and repairs for numerous power equipment manufacturers. Few companies realize just how important the installation process is to ensure manufacturers' warranties are kept intact.

A BPS installation can be summed up by our customers' words of recommendation: *"high quality standards ...experience ...efficiency...safety consciousness."* Let BPS show you how we can make a positive difference in your next project.
